

4PL_pure_rlu_v3 m63

BICc = 56535.26 AIC = 55322.53

	random effect	mab_virus effect	run_id effect	goes_down effect
L_gap	Yes	Yes		Yes
m	Yes	Yes		Yes
e	Yes	No		Yes
alpha	No		Yes	
k	No		Yes	

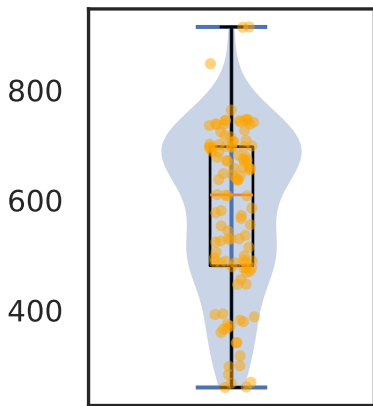

*Note: L is not directly estimated -- it is derived as $L = \text{mean_cc} + \exp(L_gap)$, using the L_gap row above. U is also not estimated -- it is simply mean_vc. Unlike other pure_rlu variants, edge is not folded into U here: edge multiplies the whole prediction afterward ($f_edge = f * (1 - edge)$).*

Binary design matrix ordered by BICc
